It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

Web site: http://genome.wustl.edu/gsc Contact: sapiens@watson.wustl.edu

code: WUGSC

Center project name: H_NH0033P21

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIRGTB/GTB/GRI/GRI sendemallto:egreen@nhgri.nih.gov/DIRGTB/GTB/GRI/GRI sendemallto:egreen@nhgri.nih.gov/or see http://genome.wustl.edu/gsc

SOURCE INFORMATION: The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa,K., Woon,P.Y., Zhao,B., Frengen,E.,

/rpt_family="L1"

NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP13-552B11; the clone sequenced to the left is RP13-552B11; the clone sequenced to the right is RP11-32P3, 2000 bp overlap. Actual start of this clone is at base position 22189 of RP13-552B11; actual end is at base position 2000 of RP11-32P3. Tateno,M., Catanese,J.J. and de Jong,P.J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Contact: sequence_submissions@genome.wi.mit.edu

It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MAPPING INFORMATION:
The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping project and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send an E-mail to

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces hansenii, Rluyveromyces inethis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BF360898 248 bp mRNA linear EST 22-NOV-2000 OV4-OT0067-060700-277-f06 OT0067 Homo sapiens cDNA, mRNA sequence.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The present invention describes isolated polypeptides, comprising an immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polymucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polymucleotides encoding them, antigen presenting cells which express the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polymucleotides encoding the polypeptides can be used as a probe or to modulate the expression of the polypeptides. AAA06641 to AAA06691 and AAA080000 to AAV82000 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                     New polypeptide useful for treating and diagnosing prostate cancer comprises an immunogenic portion of prostate tumor protein - \,

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a blological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human immunogenic prostate tumour protein cDNA sequence SEQ ID NO:213.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a DNA which encodes an immunogenic portion of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library.

                                                                                                                                                                                                                                                                            The invention relates to substantially pure prostate-specific or testis-specific polypeptides and the nucleic acids encoding them. Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Six-Transmembrane Protein of Prostate 1; STMP1; prostate cancer;

```

```
testis-specific polypeptides and the nucleic acids encoding them.
Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, benign of the testis or prostate prostatifis, testicular cancer, cryptorchidism, undescended, retractile, ascending or vanished testis. Other proliferative disorders for which the modulators may be used include lymphoma, leukaemia, melanoma, ovarian cancer, breast cancer, pancreatic cancer, liver cancer and lung cancer. The present sequence encodes a prostate specific protein, Six-Transmembrane protein of Prostate 1, STMP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Predicted transmemorate domains, but is encoded by a distinct gene, clocalised transmemorate domains, but which show no significant structural conservation, but which show no significant structural conservation, but which show no significant structural common proteins. STRAP-1 is characterised by six caracterised by six transmembrane domains and intracellular N- and C-termini, suggesting tracellular loops. STRAP-2 exhibits a manner into three extracellular and two intracellular loops. STRAP-2 exhibits a manner into three extracellular and two intracellular loops. STRAP-2 exhibits a markedly different mRNA and protein expression profile relative to STRAP-1, suggesting that these conversation appears to be very prostate specific, as significant mRNA expression is not detected in a variety of normal tissues. STRAP-2 expression is downrequiated in some prostate cancers, whereas STRAP-1 expression is generally absent. The function of the STRAP proteins is not cancers, may be ion channels (from the presence of six transmembrane domains, a feature which is shared by certain ion channels) or gap-junction proteins (from immunohistochemical staining). STRAP-1 and STRAP-expressing cells. STRAP proteins may be used to identify specific-binding agents, to produce anticancer vaccines and to generate specific-binding agents, to produce anticancer vaccines and to generate specific antibodies. The antibodies may be used for detection, prognosis, and monitoring of cancers (or susceptibility to cancer), as therapeutic and muchical action or target therapeutic agents to their site of action. STRAP muchical action and the stail and stail and the stail and the stail and the stail and the s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diagnostic and prognostic reagents, for identifying STRAP-expressing cells for screening inhibitors of STRAP expression and for therapeutic modulation/inhibition of STRAP expression. Since high levels of STRAP proteins are exposed on the cell surface, they are easily targetted by systemically administered agents, and because they are expressed mainly on prostatic epithelial cells, agents targetted to them should have minimal side effects on other tissues.
predicted transmembrane domains, but is encoded by a distinct gene,

```
testis-specific polypeptides and the nucleic acids encoding them.

testis-specific polypeptides and the nucleic acids encoding them.

Also included are vectors and host cells expressing the proteins, a

transgenic animal expressing the protein, antibodies against the

proteins, probes for detecting the nucleic acids, antisense molecules

for the nucleic acids and methods of isolating modulators of the

proteins. Compounds that modulate the prostate specific or testis

specific polypeptide are useful to diagnose, prevent or treatidisorders

of the testis or prostate particularly prostate cancer, benign

of the testis or prostate particularly prostate cancer, benign

cryptorchidism, undescended, retractile, ascending or vanished

testis. Other proliferative disorders for which the modulators may be

used include lymphoma, leukaemia, melanoma, ovarian cancer, breast

cancer, pancreatic cancer, liver cancer and lung cancer. The

present sequence represents partial exon 6 sequence of a prostate

specific protein, Six-Transmembrane Protein of Prostate 1, SIMP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; Six-Transmembrane Protein of Prostate 1; STMP1; prostate cancer; benign prostatic hyperplasia; acute prostatiis; testicular cancer; cryptorofhidism; testicular disorder; proliferative disorder; lymphoma; leukaemia; melanoma; ovarian cancer; breast cancer; pancreatic cancer; liver cancer; lung cancer; cytostatic; ds; exon 6; ORF2.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The conjudentides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or totreat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as foot supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Ass&4497-AsS&4564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed securing in the contractly from WIPO active to the contract of the contract of the members of the invention of the contract o

The invention relates to substantially pure prostate-specific or testis-specific polypeptides and the nucleic acids encoding them. Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules of or the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, oryptorchidism, undescended, retractile, ascending or vanished testis. Other proliferative disorders for which the modulators may be used include lymphoma, leukaemia, melanoma, ovarian cancer, breast cancer, pancreatic cancer, liver cancer and lung cancer. The present sequence represents the open reading frame of a prostate
    prostate cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polynucleotide for the diagnosis, prevention and treatment for prostate and testis disorders, particularly prostate cancer, comprises prostate-specific or testis-specific nucleic acids

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to renerating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical clisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capposible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and animo acid sequences. The present sequence is human six transmembrane epithelial antigen of the prostate (STEAP)-2 clone GTD3 cDNA. STEAP-1 a member of cell surface serpentine transmembrane antigens. STEAP-2 gene is located on chromosome 7q21 and is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells composition to the patient. Treating a patient with a cancer that composition to the patient. Treating a patient with a cancer that composition to the patient of killing cells expresses STEAP, or inhibiting growth or killing cells expressing STEAP, composition to the patient or killing cells expressing for the patient a vector encoding single chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody is expressed intracellularly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
 proteins, expressed in human cancers, useful for detecting and treating

```
testis-specific polypeptides and the nucleic acids encoding them.

Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the proteins, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, benign or prostate proteins, carticularly prostate cancer, benign cryptorchidism, undescended, retractile, ascending or vanished testis other proliferative disorders for which the modulators may be useful cancer, branch and lung cancer, breast cancer, branch and properties are prostate and lung cancer. The present sequence encodes a prostate specific protein, Six-Transmembrane
                                                                                                                                                                                                                                                                                                             prostate and testis disorders, particularly prostate cancer, comprises prostate-specific or testis-specific nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1510 CCAGAATTACAATTGAGGGCAAAACAAGAGCAAGAACAAAGTTTGGTGGTGTATAAAATC 1451

The invention relates to substantially pure prostate-specific or Also included are vectors and the nucleic acids encoding them. Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, benign prostatic hyperplasia, acute prostaticis, testicular cancer, cryptorchidism, undescended, retractile, ascending or vanished testis. Other proliferative disorders for which the modulators may be used include lymphoma, leukaemia, melanoma, ovarian cancer, breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer, pancreatic cancer, liver cancer and lung cancer. The present sequence represents the second open reading frame of a prostate specific protein, Six-Transmembrane Protein of Prostate 1, STMP1.
                                                                                                                                                                                    Human; Six-Transmembrane Protein of Prostate 1; STMP1; prostate cancer; benign prostatic hyperplasia; acute prostatitis; testicular cancer; cryptorochidism; testicular disorder; proliferative disorder; lymphoma; leukaemia; melanoma; ovarian cancer; breast cancer; pancreatic cancer; liver cancer; lung cancer; cytostatic; ss; ORF2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide for the diagnosis, prevention and treatment for prostate and testis disorders, particularly prostate cancer, comprises prostate-specific or testis-specific nucleic acids
                                                                                                                                                 Human ORF2 of Six-Transmembrane Protein of Prostate 1, STMP1.

This sequence represents cDNA encoding human prostate growth-associated protein PGAMP-1. Nucleotides encoding PGAMP-1 were initially identified in a prostate cDNA library, this sequence representing a consensus.

Human prostate GDNA library, this sequence representing a consensus.

Human prostate growth associated membrane proteins PGAMP-1 and PGAMP-2

(AAY52590) may be used to raise specific antibodies and to screen for specific modulators (agonists, antagonists or other potential therapeutic agents). Antagonists of PGAMP are used to treat or prevent a vide range of cancers (solid tumours, leukaemla, lymphoma etc.) and reproductive disorders (such as infertility, endometriosis, polycystic ovarian syndrome, prostatitis). PGAMP-encoding nucleic acids, its fragments and complements, may be used for recombinant production of PGAMP proteins, in gene therapy (e.g., as antisense molecules, triplexforming molecules and ribozymes), and as diagnostic probes and primers. Anti-PGAMP antibodies may be used for diagnosts and monitoring of PGAMP-related diseases by standard immunoassays, as therapeutic antibution of antipolis and in containing in the containing molecules and primers and complements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The invention relates to substantially pure prostate-specific or testis-specific polypeptides and the nucleic acids encoding them. Also included are vectors and host cells expressing the proteins, a transgenic animal expressing the protein, antibodies against the proteins, probes for detecting the nucleic acids, antisense molecules of or the nucleic acids and methods of isolating modulators of the proteins. Compounds that modulate the prostate specific or testis specific polypeptide are useful to diagnose, prevent or treat disorders of the testis or prostate particularly prostate cancer, benign prostatic hyperplasia, acute prostatitis, testicular cancer, oryptorchidism, undescende, retractile, ascending or vanished testis. Other proliferative disorders for which the modulators may be testis. Other proliferative disorders for which the modulators may be cancer, pancreatic cancer, liver cancer and lung cancer, breast cancer, sequence encodes prostate specific protein, Six-Transmembrane
                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide for the diagnosis, prevention and treatment for prostate and testis disorders, particularly prostate cancer, comprises prostate-specific or testis-specific nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present sequence encodes prostate specific protein, Six-Transmembrane Protein of Prostate 1, STMP1, ORF2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      81

It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
